

Neil Ticktin

Neil not only plays host for all MacTech events, but aids the session chairs for all MacTech events (over 100 events since 2010). Neil has been the Editor-in-Chief and Publisher of MacTech Magazine since 1992. With both a technical and business background, Neil has authored hundreds of articles including most of MacTech's well known benchmarking articles on productivity applications, virtualization, and performance products.

Linux Servers:
Admin them in a more
“Mac-like” way.

What are we going to cover?

- OS X Server: Where it's at
- Why Linux?
- Keep it simple
- Keep it secure
- Keep it monitored

Linux OSes

- Different Distributions
 - Arch Linux
 - CentOS
 - Debian
 - Fedora
 - Gentoo
 - openSUSE
 - Slackware
 - Ubuntu

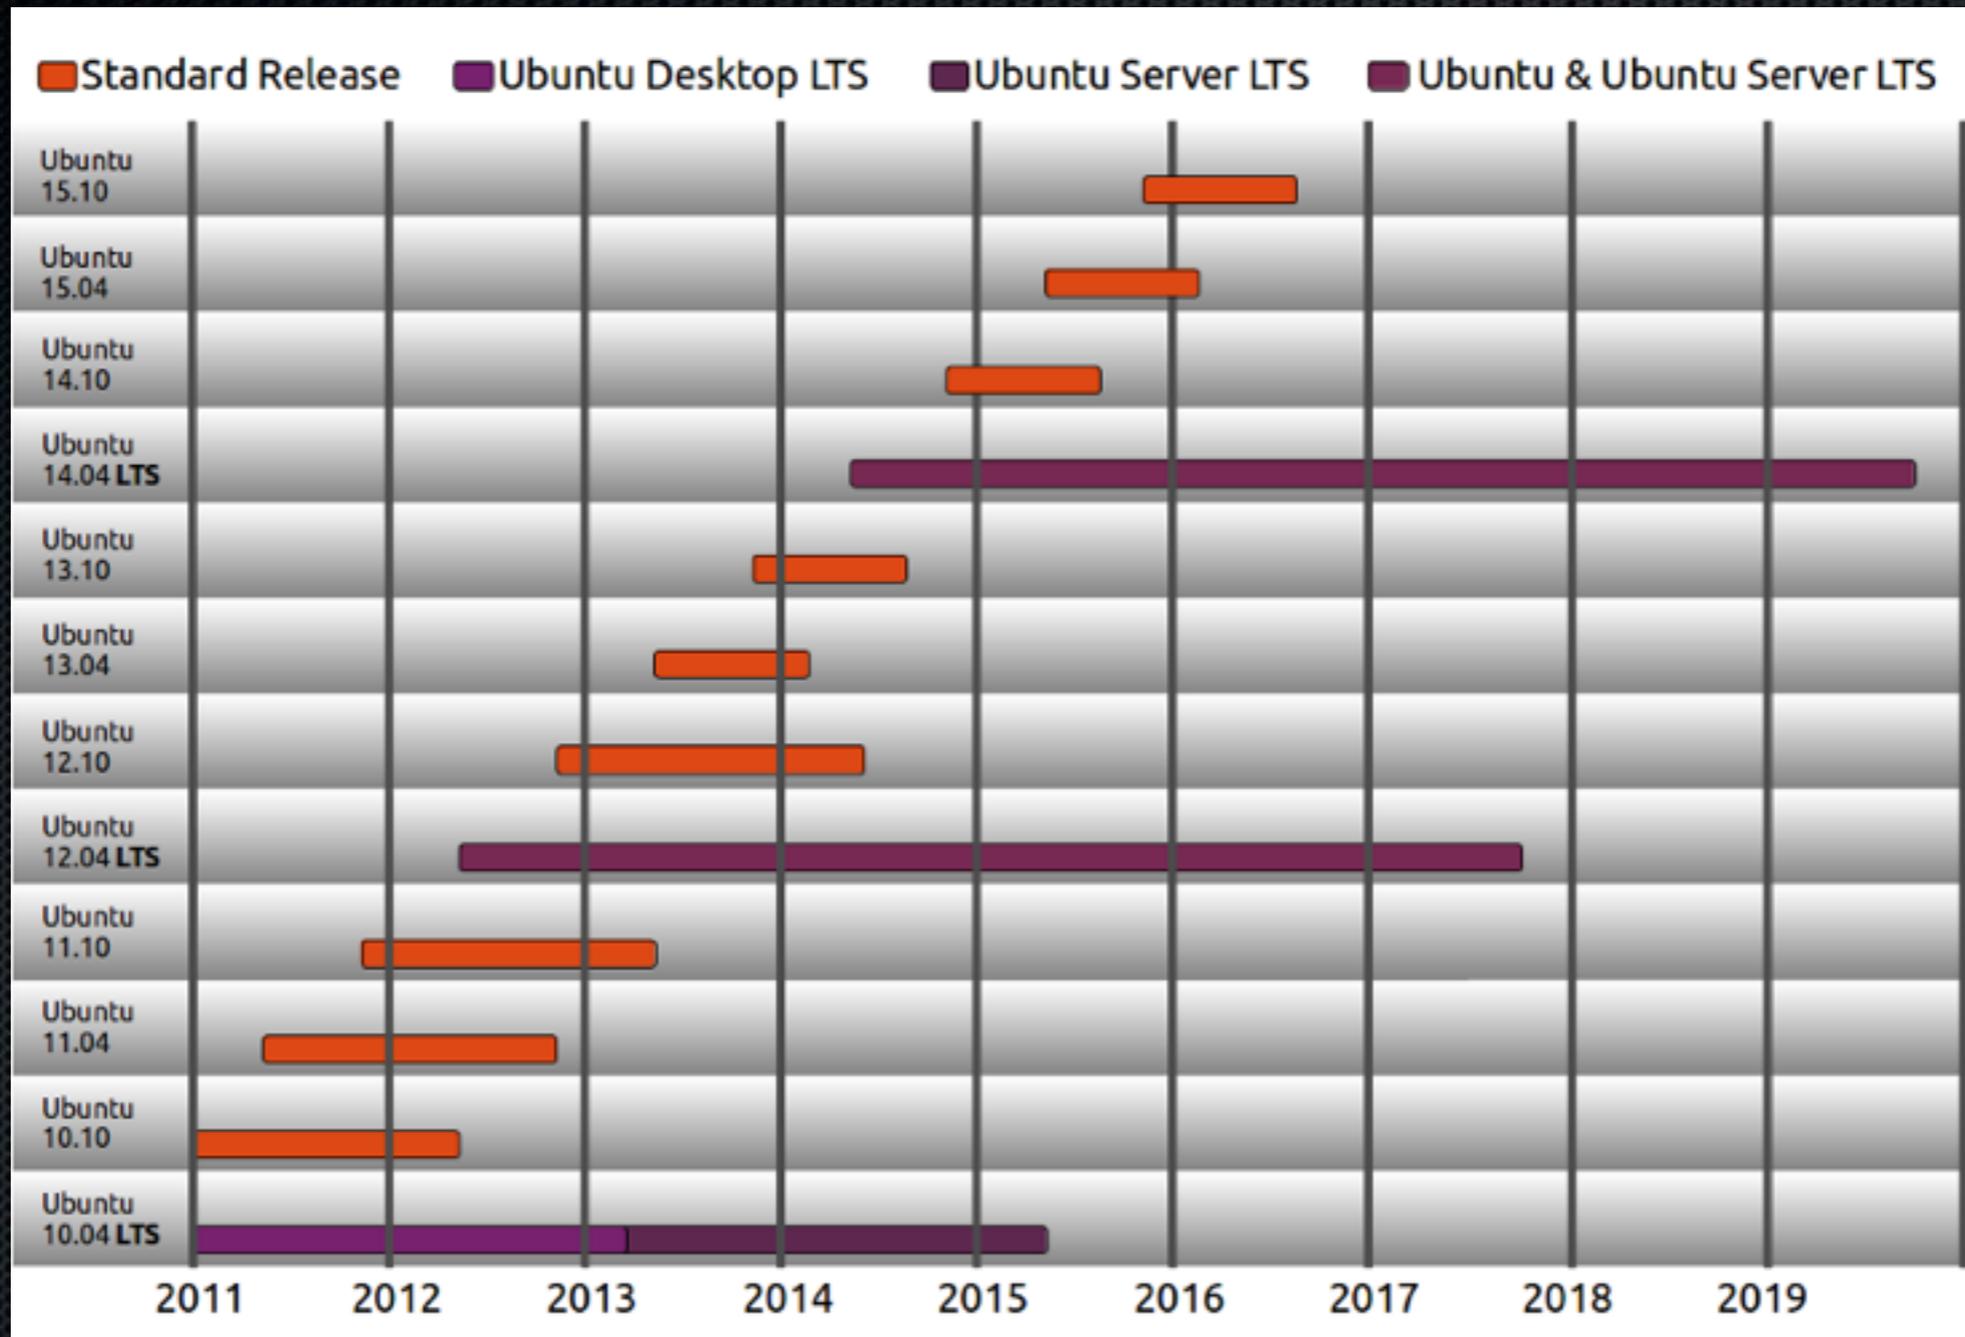

Linux OSes

- Choosing a distribution
 - Look at what you will do
 - What's supported and vibrant
 - What's compatible with your software choices

Ubuntu LTS

- What's Ubuntu Long Term Solution (LTS)?
 - Every two years
 - Five year support
 - 14.04 LTS Supported until 2020
 - Focus on hardening functionality of existing features, not new features (generally)

Ubuntu LTS

Providers

- In-house:
 - Why?
 - Don't.
- Traditional providers
 - HostGator, DreamHost, BlueHost, GoDaddy, I & I
- Linode, Digital Ocean, VPSie, VULTR, and others
- Specialized Providers
 - Drupal: Acquia, Pantheon, etc...
 - WordPress: WordPress.org, Pantheon, etc...

Real World Setup

- Examples for our process
- Tools selected important
 - Compatibility
 - Order of install:
 - Longview often first
 - Server management panel must be already installed, nor any web service

Why we chose Linode

- Competitive pricing
- Better support
- Longview
- Interface easier to understand
- Backups that made more sense

Let's Build a Linode

- Add a linode (choosing size and data center)
- Deploy an Image
 - Ubuntu 14.04 LTS
- Choose size for swap disk and main disk
 - Generally, use max size of 512MB for swap
 - Can do multiple disks
 - May want to reserve for later
- Settings > Linode Label (enter new name and save)

Linode: IP and DNS

- Remote Access tab, and you'll see your server's IP address listed
- Add the IP to your DNS
- Set the reverse DNS
 - Remote Access » Reverse DNS
- Boot the Linode

Linode: Hostname

- ssh to server
 - Click on the Remote Access tab
- Set the hostname:
 - Replace *hostname* with a fqdn of your choice.
 - `echo "hostname" > /etc/hostname`
 - `hostname -F /etc/hostname`

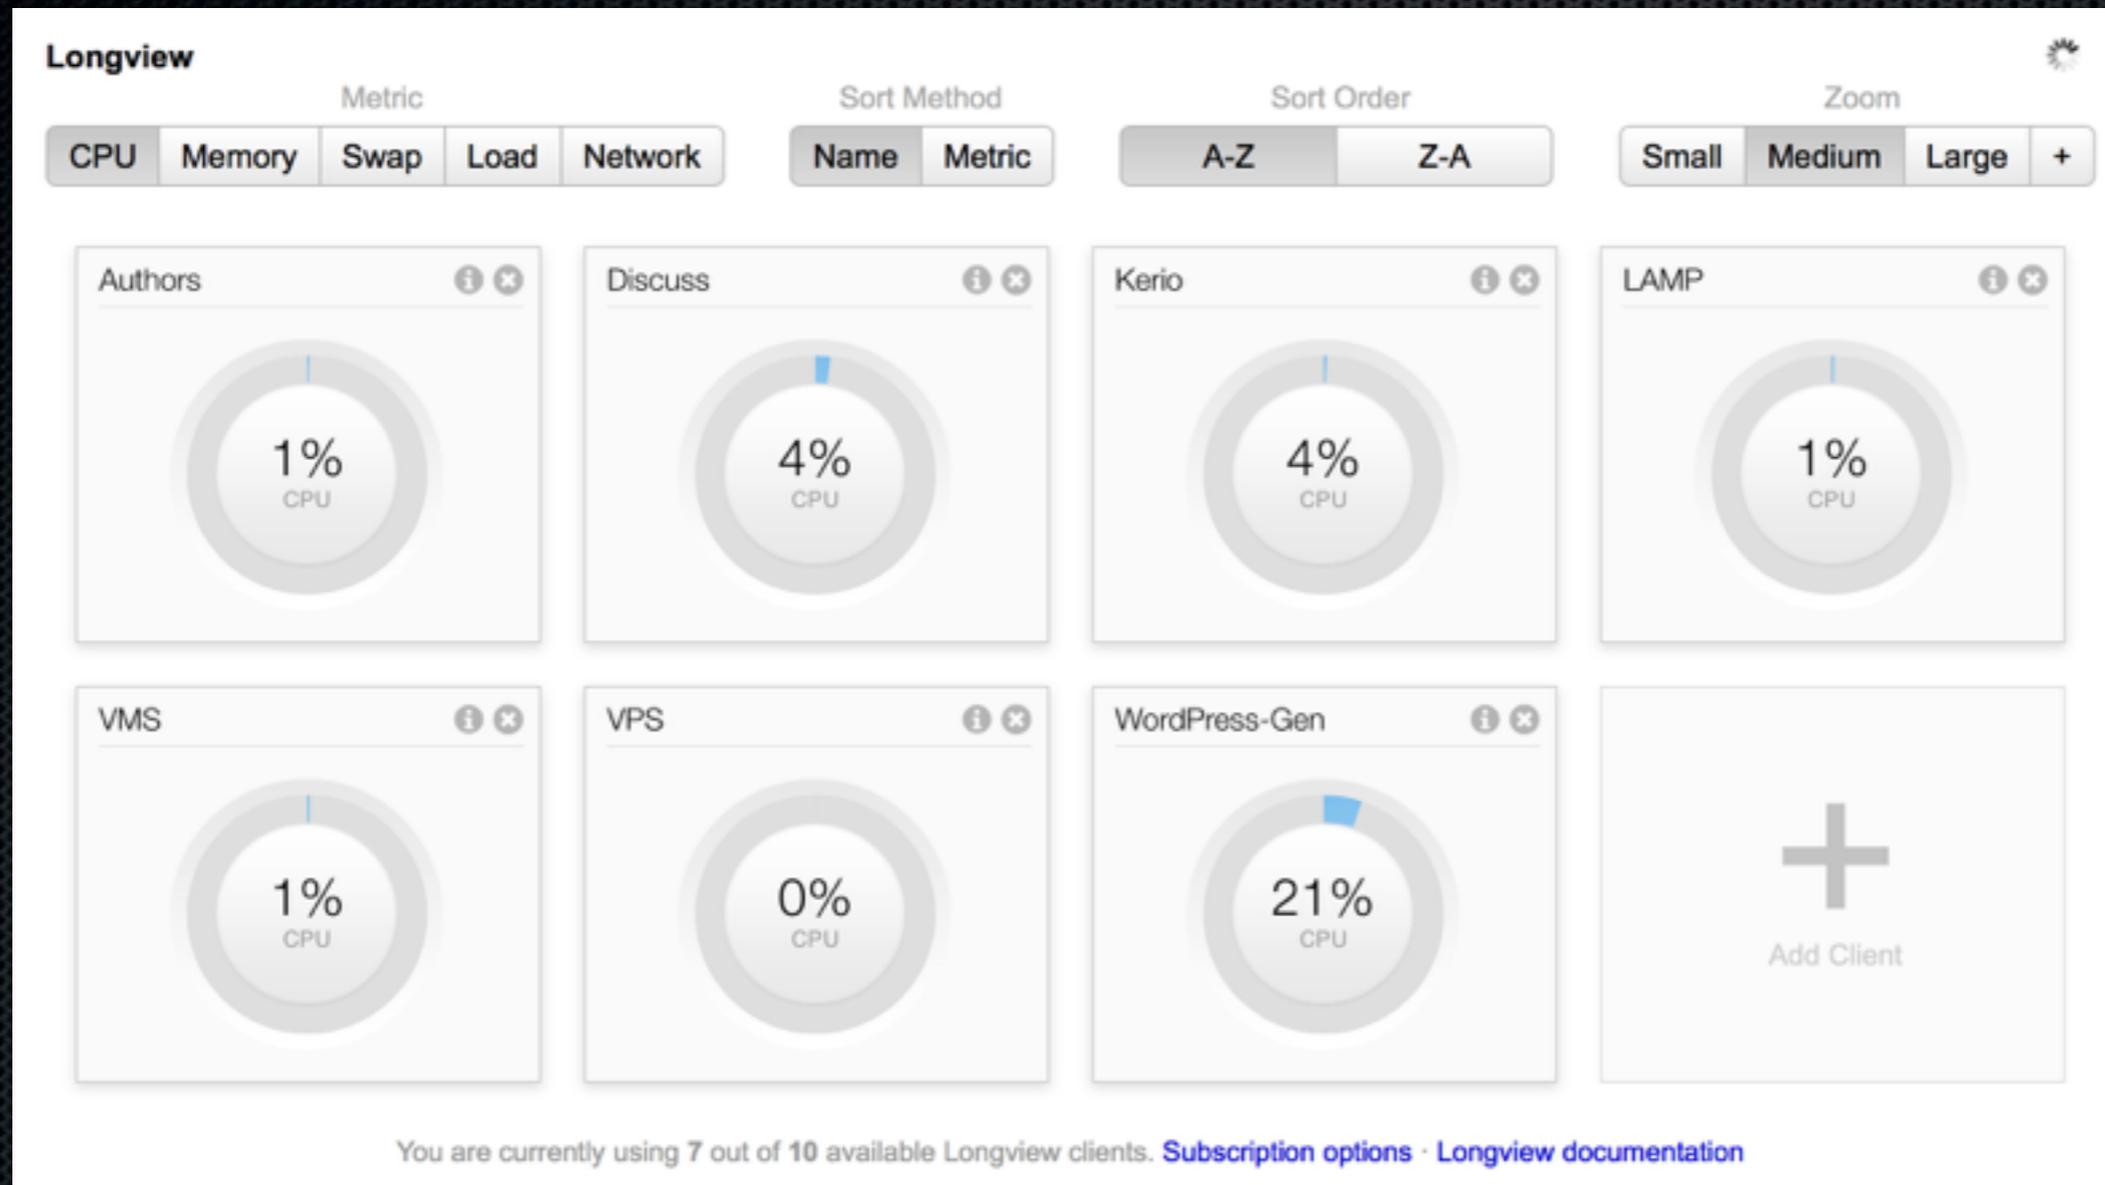

Linode: Time Zone

- Set the time zone for the server with this command:
 - `dpkg-reconfigure tzdata`
 - follow the on screen messages
 - select your region, and time zone

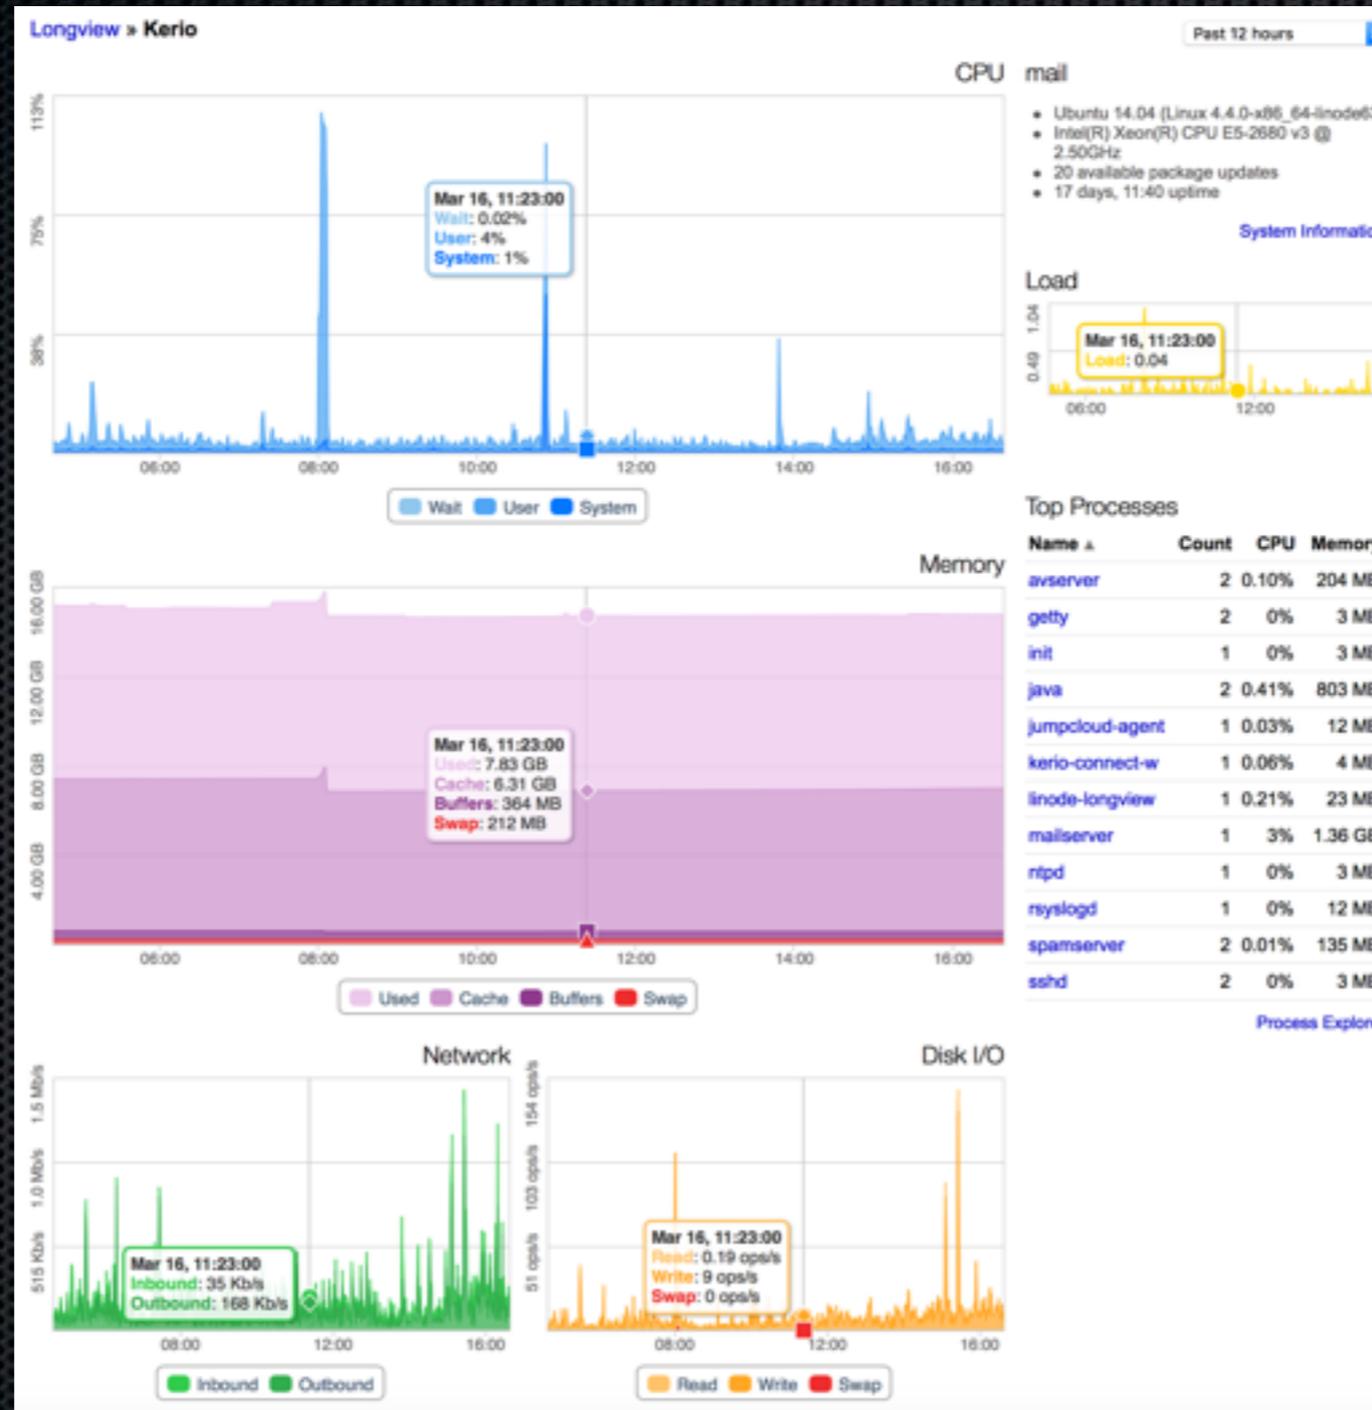

Linode: Monitoring

- Longview
 - Press the “+” to add a client
 - Copy command to install Longview via the curl
 - Rename your Longview
 - the “i” icon for the new Longview
- Watchman Monitoring (to come)
- Enable Backups:
 - Costs 20% of the cost of your Linode

Linode's Longview

Linode's Longview

Control Panels

- Why?
 - Base server config
 - Services Configuration
 - Scripted Installers
 - User Access
 - Database Configuration
 - Security
- Industry Standards:
 - cPanel, Plesk, InterWorx, zPanel, ISPConfig

Control Panels

- Light, fast, and secure with modern interface
- New Breed, multi-servers
 - ServerPilot.io
 - webmin (virtualmin)
 - Sentora <http://sentora.org>
- Single Servers
 - Webuzo
 - VestaCP

Types of Services

- Nginx Web Server
- Apache Web Server (as backend)
- Bind DNS Server
- Exim or other mail server
- Antivirus Antispam
- Dovecot POP3/IMAP Server or others
- MySQL Database Server
- FTP Server
- Firewall and automatic banning
- ... and others

VestaCP

The screenshot displays the VestaCP web interface for user management. The browser address bar shows `vps.xplain.com:8083/list/user/`. The navigation menu includes: VESTR, Packages, IP, Graphs, Statistics, Log, Updates, Firewall, and Server. A user profile for 'admin' is selected, showing the following statistics:

USER	WEB	DNS	MAIL	DB	CRON	BACKUP
users: 1 suspended: 0	domains: 1 aliases: 1 suspended: 0	domains: 0 records: 0 suspended: 0	domains: 1 accounts: 0 suspended: 0	databases: 1 suspended: 0	jobs: 7 suspended: 0	backups: 3

Below the statistics, the user 'admin' is detailed as a 'System Administrator' with the following configuration:

Bandwidth: 0 mb	Web Domains: 1 / 100	Email: netadmin@xplain.com
Disk: 2 mb	DNS Domains: 0 / 100	Package: default
Web: 1 mb	Mail Domains: 1 / 100	SSH Access: bash
Databases: 0 mb	Databases: 1 / 100	IP Addresses: 1
Mail: 0 mb	Cron Jobs: 7 / 100	Name Servers: ns1.localhost.ltd ns2.localhost.ltd
User Directories: 1 mb	Backups: 3 / 3	

At the bottom, it indicates '1 account' and provides a link to 'Open # on this page in a new tab'.

webmin

The screenshot displays the Webmin web interface in a browser window. The browser's address bar shows 'vms.xplain.com:10000'. The page title is '(1) Webmin 1.791 on vms.xplain.com (Ubuntu Linux 14.04.1)'. The interface has a dark blue sidebar on the left with a search bar and a menu containing items like 'Webmin', 'System', 'Servers', 'Others', 'Networking', 'Hardware', 'Cluster', 'Un-used Modules', and 'Refresh Modules'. At the bottom of the sidebar, there are icons for help, star, settings, and a user profile labeled 'root'. The main content area is titled 'System Information' and features four circular progress indicators for CPU (2%), REAL MEMORY (13%), VIRTUAL MEMORY (0%), and LOCAL DISK SPACE (4%). Below these indicators is a table of system details.

System hostname	vms.xplain.com (45.33.61.224)
Operating system	Ubuntu Linux 14.04.1
Webmin version	1.791
Virtualmin version	5.01
Theme version	Authentic Theme 17.72
Time on system	Wednesday, March 16, 2016 9:41 AM
Kernel and CPU	Linux 4.4.0-x86_64-linode63 on x86_64
Processor information	Intel(R) Xeon(R) CPU E5-2680 v2 @ 2.80GHz, 4 cores
System uptime	2 days, 16 hours, 38 minutes
Running processes	162
CPU load averages	0.01 (1 min) 0.06 (5 mins) 0.06 (15 mins)
Real memory	3.81 GB total / 534.30 MB used
Virtual memory	500 MB total / 0 bytes used
Local disk space	43.19 GB total / 41.04 GB free / 2.15 GB used
Package updates	147 package updates are available

Or choose none...

- Remember...
 - Ask yourself why?
- And if none, you need to remember
 - Updates and Security Patches
 - Prevent password and root login
 - Firewall
 - Monitoring

Auto-Updates

- `sudo apt-get install unattended-upgrades`
- `sudo dpkg-reconfigure -p low unattended-upgrades`

Check the Schedule

```
mactech@someserver:~$ cat /etc/apt/apt.conf.d/10periodic
APT::Periodic::Update-Package-Lists "1";
APT::Periodic::Download-Upgradeable-Packages "0";
APT::Periodic::AutocleanInterval "0";
```

```
mactech@someserver:~$ cat /etc/apt/apt.conf.d/20auto-upgrades
APT::Periodic::Update-Package-Lists "1";
APT::Periodic::Unattended-Upgrade "1";
```

Note: The 1 means it will update every day. 7 is weekly

Forcing Updates

- Find available updates, and force an upgrade now:

```
sudo apt-get update
```

```
sudo apt-get dist-upgrade
```
- Testing it?
 - list available updates

```
sudo apt-get -u upgrade
```
 - simulate update process

```
sudo apt-get -s upgrade
```
- Brute Force Testing
 - `sudo reboot now`
 - you should not see updates now

Managing Users

- JumpCloud
 - <https://console.jumpcloud.com/#/systems>
 - get your Linux install curl command and execute it at the command line for the ssh session you have to the server
 - add a tag to the system so you can manage it
 - make sure to assign yourself (and anyone else) and the server
- Other solutions as well

JumpCloud

JumpCloud Users All your users at-a-glance greg.keller@jumpcloud.com

Integrated Monitoring

- Go to your watchman setup:
- define the group
- install on (two commands) watchman client

```
run-client --auto-update true  
sudo run-client -F
```

Tools and Utilities

- ncd

```
apt-get install ncd
```

```
apt-get install yum
```

```
apt-get install yum-utils
```

```
yum-config-manager --enable
```

ncdu

```
neil — neil@mail: / — ssh mail — 80x24
